

Integration Options in MonitorPro

In addition to the collection of environmental data, an integral part of environmental regulations and permits is the analysis of said data and generation/submission of reports to required agencies. This often requires the import of additional data from external sources, such as weather or lab data, for further analysis with the collected field data.

Therefore, an environmental data management software system requires the tools to not just collect and store environmental data, but also provide ways to both easily manage it, analyse it, export it to other software tools, and create outputs required for reports.

Powerful and Flexible Integration Options in MonitorPro Make it the Best Choice for Environmental Data Monitoring

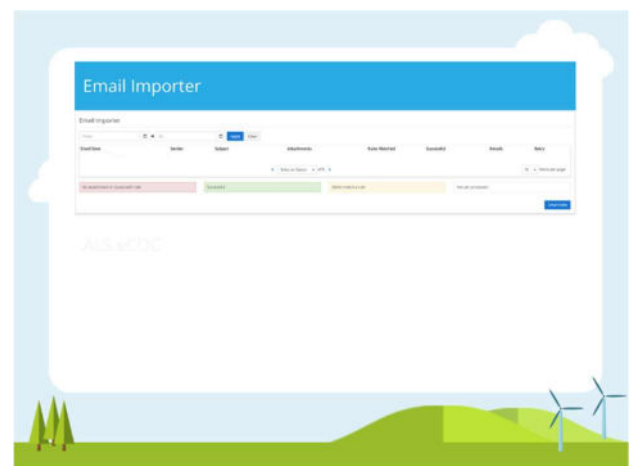

Several different integration features are available in **MonitorPro** to aid in your environmental data analysis, ensuring **MonitorPro** meets all your environmental analysis and reporting needs:

Email Importer

The **MonitorPro** Email Importer directs data files to the correct import workflow by applying a range of rules to incoming emails.

- These emails are processed, and attachments are stripped for import.
- This removes the need for manually processing routine emails and eliminates issues of employee absence, shared inboxes, and human error.

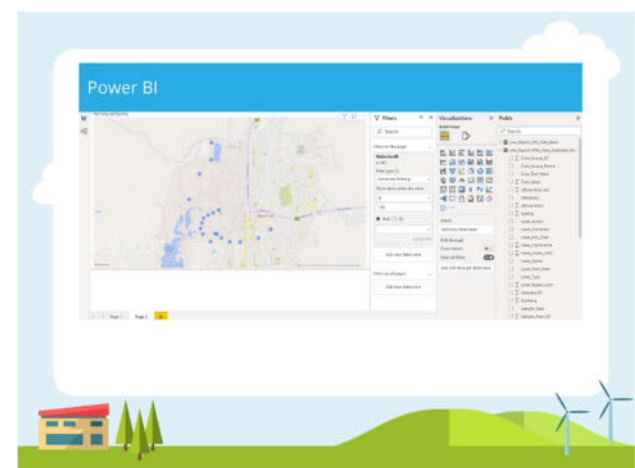

Database Importer

MonitorPro has an inbuilt Database importer for connecting to other database systems, often used to import data from historians such as PI and SCADA where required data can be pulled at a set frequency for further reporting.

Tableau and PowerBi

Tableau and PowerBI enable users to visualise their data securely stored in **MonitorPro**.

- Your **MonitorPro** database can easily be connected to Tableau or PowerBI via secure connection to create content for reports using this data.

MonitorPro

ALS eCOC and eQuote

ALS eCOC: **MonitorPro** supports the ALS standard for an electronic chain of custody (eCoC) format.

- Clients can generate these electronic eCOC from **MonitorPro** using the Monitoring Scheduler, which details the required fields ALS needs to register the samples.
- The eCOC can then be sent from **MonitorPro** either straight to the lab directly or to another workflow.

The screenshot shows the 'ALS eCOC' interface. It features a blue header with the title 'ALS eCOC'. Below the header, there is a form with several fields: 'Attachments' (with a dropdown menu), 'Request' (with a dropdown menu), and 'Sampling Complete message will be sent' (with a dropdown menu). There are also fields for 'Email subject' and 'Email body'. The email body field contains a message: 'This email has been sent because all samples requested for the unit specified on [LINKED DATE] have either been marked as taken or unobtainable.' At the bottom right of the form, there are 'Print' and 'Close' buttons.

ALS eQuote: ALS produce an eQuote which details the analytical requirements a client has requested, the cost, and the containers required for sampling.

- **MonitorPro** can accept this quote (provided as an XML) to automate the creation of Sample Templates which are the basis for the **MonitorPro** Monitoring Scheduler.

The screenshot shows the 'ALS eQuote' interface. It features a blue header with the title 'ALS eQuote'. Below the header, there is a form with several fields: 'eQuote Import - EB021LEET23001', 'File Name', 'eQuote Code', 'eQuote Number', 'Project', 'Location', and 'Data Source'. There are also 'Print', 'Refresh', and 'Abandon' buttons at the bottom left, and 'Print' and 'Close' buttons at the bottom right.

MonitorPro

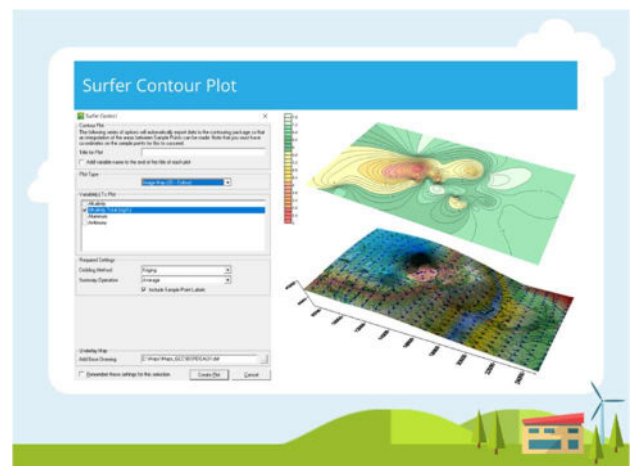

Arc Map GIS

Through **MonitorPro's** direct database access users can connect Arc Map GIS to their database for further data visualisation.

Surfer

MonitorPro enables the exporting of data into Surfer, enabling the rapid display of contour plots and classed post maps for data visualisation.

Time to Choose MonitorPro for Environmental Data Management

MonitorPro offers diverse options for incoming and outgoing integration with other systems, resulting in both seamless data importing and streamlined onward reporting. This provides significant time savings as users can easily access a range of data types in a single, secure, and readily accessible location.
