

Environmental Data Management for the Metals and Minerals Processing Industry

MonitorPro is trusted by large processing organisations worldwide for managing their environmental data.

By working closely with our metals and minerals processing clients we are aware of the specific challenges they encounter and have continually developed **MonitorPro** to be flexible enough to deal with the most complex industrial processes and associated monitoring.

MonitorPro assists our metals and minerals processing clients to manage the large volume of data they are required to collect, in one central solution. **MonitorPro** combines process data, emissions data, and more periodic monitoring requirements for centralised reporting and data analysis.

MonitorPro: The perfect EDMS for the Metals and Minerals Processing Industry

With **MonitorPro**, data management is automated as far as possible which significantly enhances data accuracy and reduces the time required to import, analyse, and report. This frees environmental teams to spend more time managing environmental impacts, rather than the environmental data itself. Environmental data from disparate sources and multiple locations can be compared and analysed in one centralised location.

Metals and Minerals Processing Implementations

MonitorPro has been successfully implemented across a range of metals and minerals processing locations, enabling these sites to manage their environmental data much more efficiently, effectively, and appropriately. As a result, **MonitorPro** can help eliminate the need for spreadsheets and manual processes, streamlining both internal and external data collection processes.

Copper Refinery Implementation

Environmental compliance is monitored across two separate locations in Australia, and an automated management system with powerful flexibility and high frequency reporting was essential. The team utilise **MonitorPro** functions such as compliance highlighting, scheduling and automated reports to significantly reduce their administrative workload.

Steel Works Implementation

A major steel manufacturer in Australia implemented **MonitorPro** as an effective and flexible solution that covers all environmental data management requirements at two different sites. Utilising **MP-Field** for data collection and the automated processes within **MonitorPro** has eliminated the need for spreadsheets and manual processes, streamlining both internal and external data collection processes.

"MonitorPro is exactly what we needed; an environmental data management and reporting system that is highly capable"

Senior Environmental Advisor, minerals processing client.
