

MonitorPro

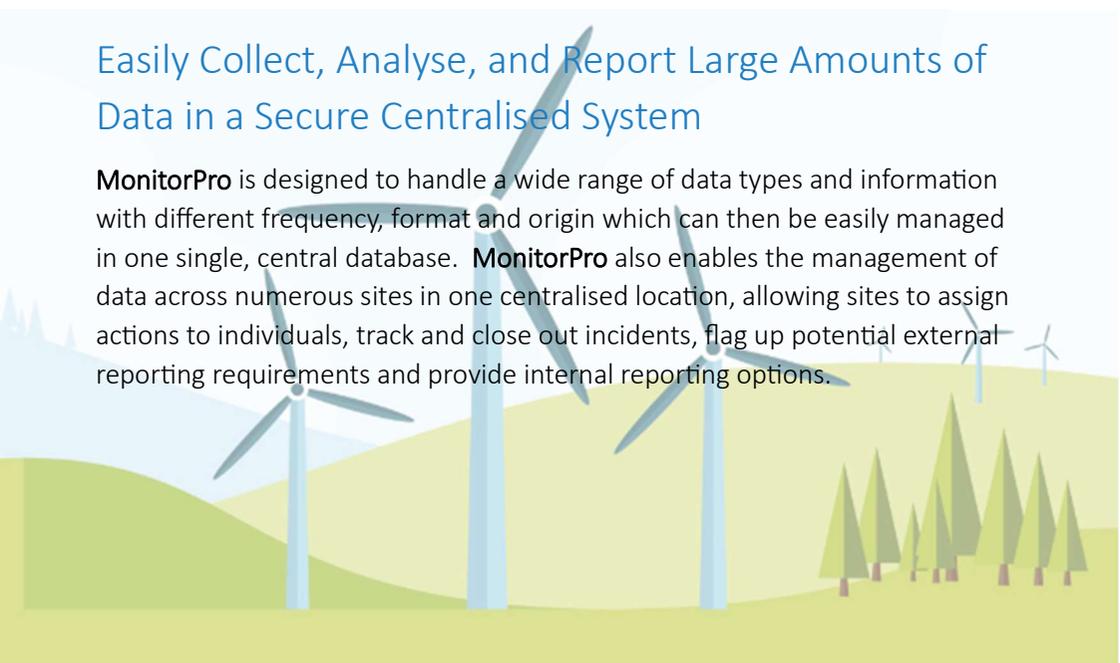

MonitorPro: The Industry standard for Waste Management Companies

MonitorPro has been used by leading waste management organisations across Europe for decades. These organisations utilise the system across many sites to manage environmental data collection and reporting needs.

The volume of data captured by waste management operators can be vast. Many of these organisations have responsibility for environmental monitoring at hundreds of sites, ranging from small scale closed landfills which still require ongoing assessment, through to large operational landfill sites. To collect and process such a large amount of data a dedicated centralised system for environmental monitoring is required to ensure full environmental compliance.

Easily Collect, Analyse, and Report Large Amounts of Data in a Secure Centralised System

MonitorPro is designed to handle a wide range of data types and information with different frequency, format and origin which can then be easily managed in one single, central database. **MonitorPro** also enables the management of data across numerous sites in one centralised location, allowing sites to assign actions to individuals, track and close out incidents, flag up potential external reporting requirements and provide internal reporting options.

Waste Management Implementations

MonitorPro has been implemented at most operators within the waste management industry in the UK, significantly enhancing their ability to manage environmental data throughout its entire lifecycle, from collection and analysis to reporting. Improved data management using **MonitorPro** has been instrumental in supporting ongoing regulatory compliance for waste management operators.

UK Waste Management Implementation

The UK's leading waste management organisation has been using **MonitorPro** since 2004. Previously they relied upon a spreadsheets and paper copies of reports which were manually input into the system. This was both laborious and error prone, making incident management tracking difficult. Now they utilise **MonitorPro** for inputting and analysing a range of different data types (waste acceptance data, groundwater, leachate, dust, weather, gas, and noise), and it's reporting system to track and ensure environmental compliance.

Spanish Waste Management Implementation

One of Spain's leading waste management companies implemented **MonitorPro** in 2018. Covering industrial installations such as their landfills and energy recovery facilities, our client uses MonitorPro to ensure the permitted monitoring is completed and checked against their compliance, as well as managing and assessing their costs in respect of their laboratory analysis.
