

Database Building and Data Management Services

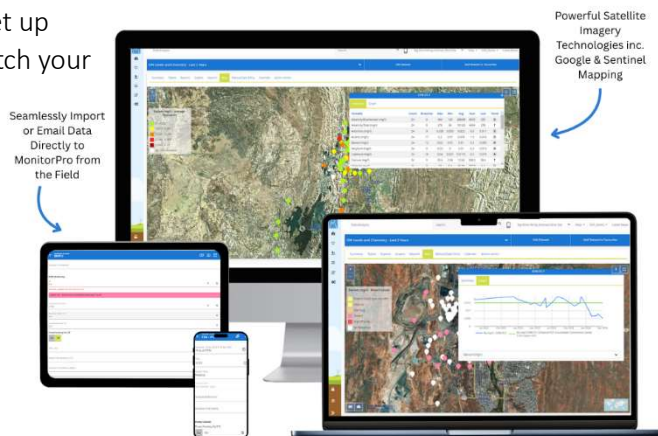

EHS Data offers a full service to create your system and keep it running smoothly. **MonitorPro's** highly configurable system means it can be tailored to suit your organisation's requirements, and with over 65 years of combined implementation experience and 100s of **MonitorPro** projects, our trusted and experienced team here at **EHS Data** has you covered.

Database Framework

MonitorPro is very flexible, we work with you to determine a folder structure and contents that match your operations (sites, sample points, parameters, etc.). Next, we populate with compliance and other validations rules, calculations, monitoring and reporting schedules, and set up automatic importers to match your data streams.

Database Building

At the start of your implementation an **EHS Data** consultant will work with you to scope out requirements for your new system. This is a two-phase task, first designing the framework, and second populating with historical data.

Data Entry, Resolution and Quality Management

Historical Data Entry

Organisations usually require either all or some of their historical data migrated into their new framework. Often historical data has significant quality and consistency issues, so importing a completed framework validates and ensures consistency as a part of the process. **EHS Data** can either manage the complete process, liaising as needed, or you can pre-process files for import and validation yourself.

System Configuration

We can set up and continue to support you in keeping your compliance, warning limits, monitoring schedules, and scheduled outputs up to date.

Report Generation

Your **EHS Data** consultant will discuss the outputs you need and if required design the resulting templates, they will also make sure these outputs are generated and delivered to the right people at the correct time and frequency.

Ongoing Support and Maintenance

As well as guiding you through the initial **MonitorPro** implementation our experienced team will continue to provide you with the best training, support, and advice. Helping you to continually achieve and maintain your environmental data requirements.
